Project Brief

This is the final project of DSGN 100, taught by Dr. Steven Dow. Our group made a kiosk that is used to reserve study rooms on campus. The kiosk is a prototype and is not actually functional besides the kiosk screen.

My Role

While everyone in the group worked on all parts of the project, I was the person in charge of the sketches, storyboards, and the application prototype on Figma.

Overview

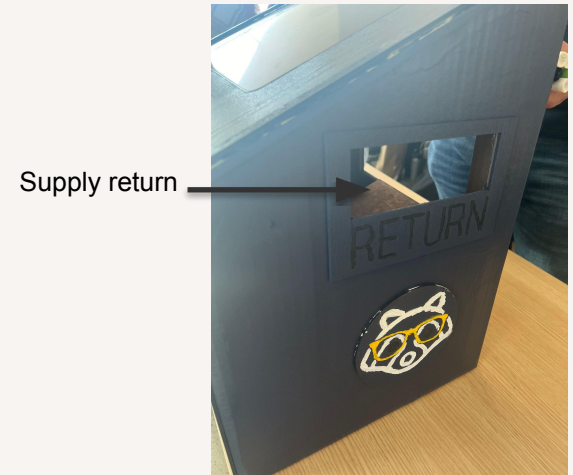

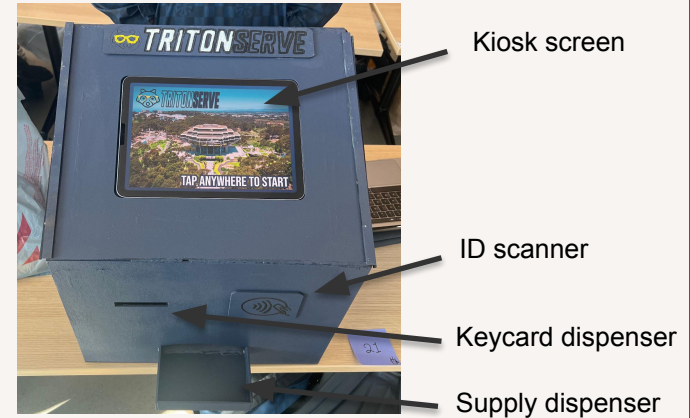

Study Room Reservation Kiosk

When using study spaces on campus, students are often faced with the challenge of navigating their way to spaces in the library and having to deal with other students using their space during a reservation.

We designed a kiosk to streamline the study room reservation process by offering secure access and navigational aid to place convenience at the forefront of the study experience.

The function of the kiosk includes

- On-site reservation access
- Map layouts for each floor of the library with reference points
- Dispenses keycards to ensure exclusive access to study room
- Dispenses markers and other study supplies

User Research

Method

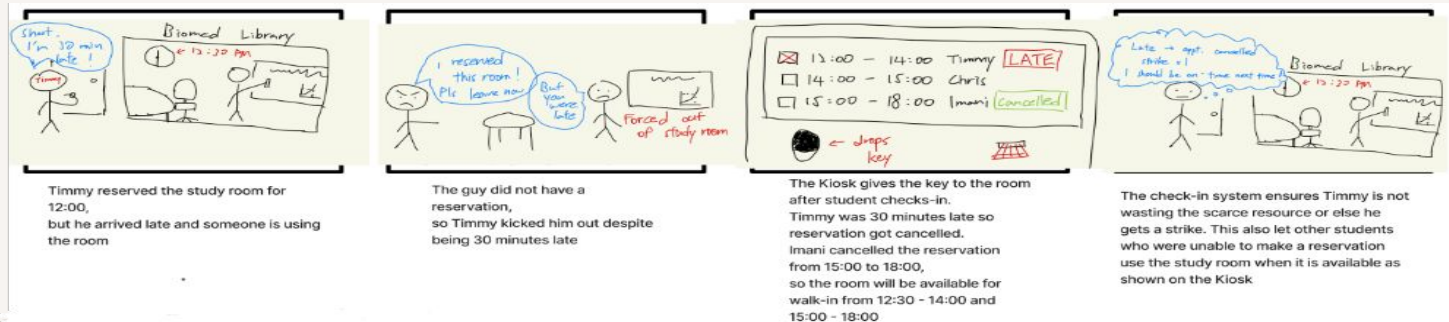

1. Online research, field observation, and stakeholder interviews
2. Sketches, user personas, and storyboard
3. Stakeholder interviews with proposed solution

Pain points:

1. People often reserve study space and not show up
2. Sometimes people use the study space someone else already reserved
3. The study spaces often do not have supplies such as markers for the whiteboard

Mission Statement:

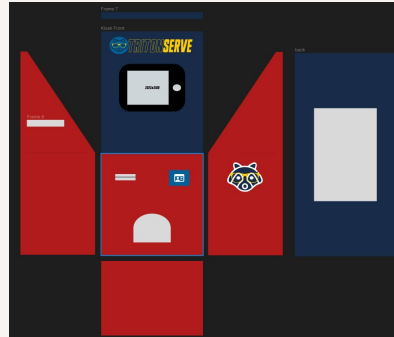

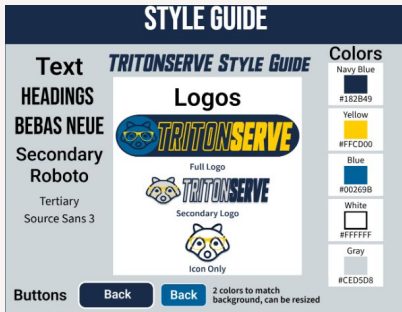

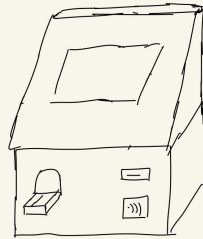

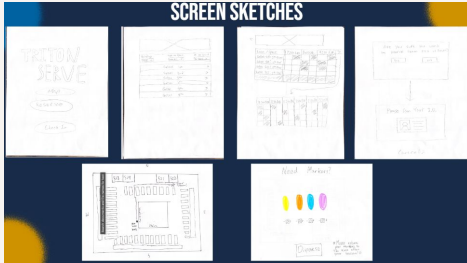

We believe that we can better allocate our campus' academic resources by creating a more modern and flexible reservation and check-in system for Geisel Library

Prototypes and Demonstration

Note: Due to limitation on portfolio size, lower quality pictures were omitted

Learning Outcome

Takeaways

- The steps and methods of user research
 - Familiarized with the steps of user research, including online research, field observations, stakeholder interviews, sketching, and storyboards
 - Using a design jam to keep track of all the progress and other researcher's perspective
- Software and hardware prototyping skill
 - Software prototyping and basic graphic design with Figma
 - Hardware prototyping with Inkscape to laser cut and Fusion 360 to 3D print, hands-on experience crafting to actual prototype
 - Keeping track of design elements for consistency throughout the project with mood board and style guide
